Website SEO Recommendation

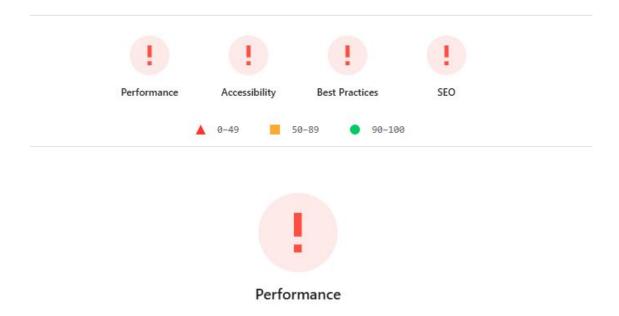

www.newsest.com

Website Speed Optimization

The current website speed is not satisfactory. For a news website, fast loading is crucial to retain readers, improve search rankings, and ensure smooth browsing across devices.

Daily Sitemap Update

For a news website, the sitemap should be updated daily so that search engines can quickly index new articles. Currently, the last sitemap submission was on 2025-07-03, which needs improvement.

Correct Internal Category Linking

At present, the internal links for categories and subcategories in posts are showing "#" pages. These links should point to accurate categories to improve navigation, SEO, and user experience.

Fix Breadcrumb URLs

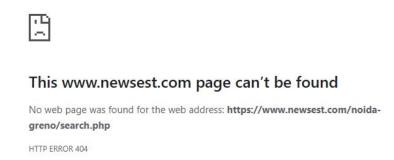

The breadcrumb URLs on the website are not set correctly. For a news website, proper breadcrumbs are essential to guide users, enhance navigation, and support SEO indexing.

Search Box Functionality - Not Good

The search box is not working properly, making it difficult for users to find news articles. A fully functional search feature is crucial for better user experience and content accessibility.

Internal Linking in News Articles - Not Good

Currently, no internal linking has been added within news articles. Going forward, relevant internal links should be included wherever possible to improve SEO, keep readers engaged, and increase page views.
